

From LLMs to Agents

Nice to meet you! 🤗

- **Master Degree of Computer Science** @ UniFi
- **European PhD** @ CVC (Barcelona) and UniFi
- **AI Research Scientist** in Paris 🇫🇷

Contacts:

Email: gemelli.andrea@hotmail.com

Portfolio/Blog: <https://www.andreagemelli.me/>

Cool Projects and Collaborations with Students

- **BoundingDocs** w/ Simone G.: a dataset for grounding question answering on documents
 - Dataset downloaded 20k+ on [hugging face](#)
- **DocExplainer** w/ Alessio C.: a wrapper explainable model that can be used together with “any” LLM
 - Paper <https://arxiv.org/pdf/2509.10129>
- What next?

Roadmap

01 **LLMs**

02 **Agents**

03 **Agentic Document AI**

PART 01

LLMs

The language unit measure: a token

LLMs are fed by text chunks called **tokens**.

For simplicity, you can think 1 token ~ 1 word (in reality 1 word can be 1 to 3 token)

Tokens are sub-word units by a trained algorithm e.g. BPE or SentencePiece.

The vocabulary is the dimension of the dictionary that stores indices (keys) to their token (chunk of text) and viceversa

Tiktokenizer

The autoregressive objective

An LLM models predict the next token given all previous ones:

$$\mathbf{P}(\mathbf{x}_t \mid \mathbf{x}_1, \dots, \mathbf{x}_{t-1} ; \theta)$$

The Training loss is a Standard cross-entropy, averaged over a huge corpus.

$$\mathbf{L} = - \sum_t \log \mathbf{P}(\mathbf{x}_t \mid \mathbf{x}_{<t} ; \theta)$$

The autoregressive objective

An LLM models predict the next token given all previous ones:

$$P(\mathbf{x}_t \mid \mathbf{x}_1, \dots, \mathbf{x}_{t-1} ; \theta)$$

The Training loss is a Standard cross-entropy, averaged over a huge corpus.

$$\mathbf{L} = - \sum_t \log P(\mathbf{x}_t \mid \mathbf{x}_{<t} ; \theta)$$

LLMs are **stateless**: the “chat” you experience with ChatGPT, Claude etc. is just simulated!

- Every time a new token is generated, the whole conversation is read again!
- The next token is sampled among the whole distribution of the vocabulary and the one with the highest probability is taken (softmax)

From a base model to ChatGPT

- 1 Pre-training**

Next-token prediction on trillions of tokens. Output: a base model that completes text but doesn't follow instructions.
- 2 Mid-training**

Continued pre-training on curated, synthetic, or long-context data.
- 3 Post-training**

SFT and RLHF
- 4 Inference-time scaling**

Let the model think longer before answering.
Reasoning models: o1, R1, Gemini Thinking.

LLMs limitations

LLMs are limited in several aspects by design:

- **Missing Updated information:** the knowledge limit come from the data used at the time of retraining
- **Lacking Mathematical exact computation:** They hallucinate 273×1849 or “how many Rs are n raspberry”
- **No Long-context planning:** no memory among calls, one forward pass at a time
- **Limited by language:** no interaction with the “world”

A (partial) solution: Agentic LLMs

PART 02

Agents

What is an agent?

"A system that leverages an AI model to interact with its environment in order to achieve a user-defined objective. It combines reasoning, planning, and the execution of actions — often via external tools — to fulfill tasks."

— HuggingFace Agents Course, Unit 1

Brain

The LLM — reasoning, planning, deciding what to do next.

Body

Tools — APIs, code execution, browsers. The agent's capability space.

System 1 vs System 2

Kahneman, Thinking, Fast and Slow (2011)

System 1

FAST · INTUITIVE · AUTOMATIC

Pattern matching

Immediate output

No verification

≈ a single LLM forward pass.

System 2

SLOW · DELIBERATE · SEQUENTIAL

Reasoning, planning

Tool use

Verification, iteration

≈ an agent: LLM in a loop with tools.

LLMs usage and integration levels

Level	Pattern	Example	Behavior
★☆☆	Router	if llm_decides_A(): a() else: b()	LLM picks a branch
★★☆	Tool caller	run(llm_tool, llm_args)	LLM picks tool + arguments
★★★	Multi-step agent	while llm_should_continue(): step()	LLM controls iteration
★★★★	Multi-agent	if llm_trigger(): spawn_agent()	Agents spawn agents

Most production agents live at ★★☆ – ★★★. More agency means more capability and more failure modes.

The ReAct loop

Yao et al., 2022 — arXiv:2210.03629

```
while not done:
    thought = LLM(context)    # what to do next
    action  = LLM(context)    # tool + arguments
    observation = tool(action) # actually run it
    context += (thought, action, observation)

return final_answer
```

Loop until the LLM emits a final_answer.

Thought

LLM writes its reasoning as text (CoT).

Action

LLM emits a structured tool call.

Observation

Orchestrator runs the tool, returns result into the prompt.

Tools — the bridge to the real world

```
def web_search(query: str)    -> list[str]: ...
def python_repl(code: str)   -> str:      ...
def read_pdf(path: str, page: int) -> str:  ...
def send_email(to: str, body: str) -> bool:  ...
```

Two styles

JSON tool-calling — OpenAI, Anthropic, Gemini APIs.

Code agents — LLM writes Python; sandboxed run (smolagents).

Tool design is the engineering work. Clear names, typed signatures, descriptive docstrings.

A complete agent trace

USER: "Population of the capital of the 2026 World Cup host?"

THOUGHT: I need the 2026 host first.

ACTION: web_search("2026 FIFA World Cup host country")

OBS: "USA, Canada, Mexico — joint hosts"

THOUGHT: Three hosts. Get their capitals.

ACTION: web_search("capital of USA Canada Mexico")

OBS: "Washington D.C., Ottawa, Mexico City"

THOUGHT: Now populations.

ACTION: web_search("population Washington DC Ottawa Mexico City 2025")

OBS: [... numbers ...]

ANSWER: Co-hosted by USA, Canada, Mexico. Capitals' populations: ...

The LLM never knew the answer — but it knew how to find it.

Frameworks to create working Agents

- Smolagents: Minimal, code-first. HuggingFace. Great for practicing and creating small projects
- LangGraph: Graph-based, stateful. Production-oriented.
- LlamaIndex: Strong for RAG and agentic workflows over documents.

Hint: use **Pydantic** and linters (such as ruff) in your projects to make sure **output are structured** in a verifiable python type and all **tool definitions follow standard practices of typing and docstrings**

An working example: https://huggingface.co/spaces/andreagemelli/grandma_secret_sauce

PART 03

An application example: Agentic Document AI

Documents are not just text

Information in a document is spatial, not just textual.

Layout, tables, figures, charts, checkboxes, signatures — none of this survives a flat OCR pass.

A document in the wild

PDFs, scans, invoices, contracts

Scientific papers with figures and tables

Medical forms, checkboxes, multi-column layouts

Handwritten notes, stamps, signatures

Why "drop a PDF in ChatGPT" fails

1 **Loss of structure**

OCR flattens 2-column layouts; tables become unaligned tokens.

2 **No grounding**

The LLM answers — but you can't verify where in the document it came from.

3 **Visual content ignored**

Questions about charts, figures, checkboxes — the LLM guesses.

Concrete example · DeepSeek-R1 paper

Q: "R1-zero pass@1 at 4000 steps?" ChatGPT-4o → 40% (wrong). Agentic extraction → 60% (correct, region highlighted).

Cite: Khare, Going Beyond OCR+LLM, LandingAI, 2025

A taxonomy of approaches

Approach	Examples	Strength	Weakness
Pure OCR	Tesseract, Textract	Cheap, mature	Loses all structure
Layout-aware	LayoutLM, Donut, Nougat	Captures structure	Trained per-domain, brittle
Multimodal LLM	GPT-4V, Claude, Gemini	Flexible, zero-shot	Hallucinates, no grounding
Agentic extraction	LandingAI, Reducto	Verifiable, grounded	Complex, often API-based

Modern systems combine several of these.

Architecture and existing solutions

Architecture and existing solutions

Document Extraction

Developed by LandingAI

A tool that can extract structured information out of documents with different layouts. It returns the extracted data in a structured hierarchical format containing text, tables, pictures, charts, and other information.

Recap

- 01** LLMs predict the next token — capable, but stateless and toolless.
- 02** Agents = LLM + loop + tools. They “turn System 1 into System 2.”
- 03** Document AI in the era of Agents: reasoning + tool use + visual grounding.
